You can pretty much overclock anything...

I would have to agree with the dual core.. You can easily push it to around 4Ghz with a aircooler. I have seen reports on E6700 being pushed to 5Ghz with watercooling.

If you're only going for one GPU then you wont need a super powerful 1000w PSU. I have a Q6600, 2GB 800Mhz RAM, 1x 768MB 8800GTX on a 600w PSU so you should be good.
