It happens anywhere, looking in any direction, at all times. My FPS never goes above 10 on Glacier Flying, yet on all other maps it's a solid 60 (due to vsync limiting it) all the time. It seems to be completely random which computers get the absolutely crap FPS and which have no problems at all, although there must be *something* different between them that causes it.

EDIT: Aircraftkiller, I don't suppose you have, and are willing to give to someone to work on, the original .lvl file for the version of Glacier Flying that's in 1.037? This has probably been asked and answered before, but just in case...
