i didnt say larger, i read what SomeRhino quoted from the text where it says, "BTW, You won't need a telescope to see this, it will be roughly the same size as the Moon.. or so i heard (but wouldnt it mean Mars would be even closer?), anyway, it will be a suberp sight to see"

i was trying to support the thought of it being "roughly the same size" and if im wwrong im wwrong, its just a simple mistake like when you seid that the astiroid belt was in between earth and mars

im probibly wwrong but the way i wrote it made it sound really wwrong

```
..|.....|2
1|.....|
..|.....|3
```

dont mind the spacer dots i need them there so the lines stay there

in this digram if you where standing on number 1 bolth 2 and 3 would look the same size, which is what i was thinking about when i wrote that.
