Vendetta wrote on Wed, 07 January 2009 19:12andr3w282 wrote on Wed, 07 January 2009 19:06TBH if your really going to want to make a browser in VB, you may as well make it in VB.net (INBEFORE HATRED)

Reason why im saying this is because the "browser - html display" object exists in vb.net, as well as the creation of menus is quite easy and possible.

If you actually meant to make a "good" browser, don't do it in vb, go for c++ or at least c#. The difference between making this in vb.net and vb is quite little and you'll probably have less difficulty and a more advanced interface in .net. Also the .net has objects for tabbed pages.

Also, if your looking for programmign samples, examples, tutorials, snippets, or documentation i highly suggest staying away from places like youtube :\

where wo find VB.net?

Visual studio 2003,2005 or 2008.

Vb.net is an extension off visual basic but using the .NET framework (WAITS FOR PEOPLE TO GET MAD AT THIS). The .net framework is a pre-writte library to do majority of programming for every different application. It's "managed code" . The client/user of a .net application needs the .net framework installed ( version1,2,or 3).

When performance is an issue, don't use .net due to the way it was written, and used. The (dot)net framework is available to visual basic, visual c sharp, visual j sharp, visual asp ( i think ) and visual c++.

For vb.net the general syntax is the same, however vb.net has a lot more object oriented capability as well as newer operators/ways to do things.

But yeah for anymore info wikipedia or google is your friend.
