Omar007 wrote on Wed, 28 January 2009 08:13 That way you have to use multiple webpages xD

Luckily CSS 3 is coming

That supports the STRETCH function

Nice to see some CSS enthusiasts around here

CSS3 is being done in a modular way, so different parts can reach working draft stage before others. This is good so we don't have to wait as long.

The main thing we do have to wait a long time for it browsers to add support for it. IE7 is still the leading browser and they don't like to follow standards, although IE8 is supposed to make major improvements. IE6 is still the second most used browser at over 25% and we have to create so many stupid workarounds for it just to get it to display how most other modern browsers do.

I have no idea what you're referring to by "stretch function" but they do have a nice background-size which Opera, webkit and khtml based browsers (Safari, Chrome, Konqueror) have already implemented.

-o-background-size

-webkit-background-size

-khtml-background-size.

Listed in the order mentioned above.

I'm assuming FireFox 3.1 has -moz-background-size but I don't know for sure.

You may not be able to resize the backgrounds at this time, but you can change the sizes of your layers (the <div> element) with the CSS2 dimension properties. IE doesn't support the min or max properties though.

[http://w3schools.com/css/css\\_dimension.asp](http://w3schools.com/css/css_dimension.asp)

Have a look around that site, it's great for beginners.
