ok so i found this gimp dds error comment that i saw on the gimp dds plugin page
here it is

Quote:Command % Conquer RENEGADE

Memememememimimime I Have found that GIMP and Paint.Net has errors in their compression
algocodes..

Somehow the colors and dephs are bugging once you save them as DDS file
This one gives me the best work basis, i think thats the same plug soqzunnie was using in his
early m03.mix beta server..
I tried to save the files as lowest 128 color jpeg and after that into dds dxt1 compression, but the
gimp fails big time.

Can't play the skins i made back then in 2003, even while the patch stationed no changes. There
are bugs in 100% and crashes at 85% of any loaded import dds.

I guess i will have to use Corel Paint Shop Pro Photo X2 already installed on my OS!?

(------- Command Execution Failed -----------
Command Name: Format_DDS
Error Text: Plugin caused an access violation
) (n) freeware bugs me less but i am using the psp photox2 for compressing into the right dds
packs.
