having used both Intel and AMD, I would have to say they are fairly matched. AMD processors produce less heat, require almost no heatsink, and have NEVER burned out. Intel have a monster heatsink, produce alot of heat and have burned out. on the other hand, my computer has an AMD processor and i have found it to act differantly and oddly slower than my dads intel P4, which is comparatively slower. over all, i think i would go witha a P4 b/c of the last bit.
