I have run AMD chips for years. I am currently running an AMD XP 2000+ and it works great. It runs as fast as a P4 2Ghz but it was cheaper. It does require a lot of cooling though. I have a Thermaltake Volcano 11+ on the chip and it still runs fairly hot.

People who I have spoken to in real life and on the internet didn't understand what the AMD XP was and always assumed the Pentium 4 was the fastest CPU. My AMD XP 2000+ runs at 1.67Ghz but equals the performance of a Pentium 4 2 Ghz. ALthough when you get to the AMD 3000+ it does fall behind in video editing slightly.

As for the Celeron, it doesn't suck. It's a great chip, it's just not as good at handling the latest games, it was never designed to, it was designed as a cheaper alternative to the top of the range Pentium, like the Duron was, the reason they developed the chips into the Ghz speeds and above.
