HomeyHeres a comparison.
I have a
P4 1.7ghz 512 ddr and gf4 mx440
My friend has AMD 2400+ ( 2ghz) 512ddr gf4 mx420.
In a 40 player server in renegade i get 20fps at lowest quality, at max hes getting 45...

Your seeing Most of the battle, The more explosions there lower the fps, Your friend may be in a tunnel or something. :rolleyes:

AMDs get very hot. And if you leave them on alot. Well, You dont wanna know. :rolleyes:

* Motherboard may fry? Or CPU? *

Intels are much more stable, And run longer.

dufis791think about it. u can get a p4 and have no room 4 neting else, or get an AMD and have lots of room.

What the hell are you talking about? Without a Fan, those chips are small, But still, With the fan, Its pretty small compared to someother proccessors, My old P2 was very long. I don't remember much of my P3 though.
