My theory of parallel universes is that every single universe is one small quantum particle different from the other. In quantum physics a quantum particle can be anywhere randomly. Things are made out of quadrillions of quantum particles. If one part of the object's quantum particles are different it becomes a whole new object. So there are an infinite amount of universes with every single possibility happening NOW! and forever will be.

Also about parallel universes that travel back words in time. If there was a universe that did that it would conclude there was an end to time. Which there is not. So this disproves backwards time universes.

So think of it. Your twin on some other universe is having every possible thing that you wish for, dead, of the opposite sex, poor, doesn't know how to read, owns a car, and ect. It really makes a person want to travel between universes. If I ever did get to a parallel universe I would clean out my twin's bank account
