'C' class P4 processors are 400mhz FSB, designed to work with 865 and 875. Was just wondering what benefit you saw that you would buy an 875 board and put a 533fsb processor in it. Unless you had it laying around of course...

Athlon 64's have an IHS like P4's. There is no 'shim' for them. Originally Zalman 7000's did not fit socket 462 (A64 uses seven hundred and something), but I see recently that there is a 7000A that supposedly fits socket 462. Was just wondering if this is the one you got so you might can snap some pictures of the holddown clip, but odds are, yours is the older one.

But yes, Zalman makes excellent coolers. I went from a 6000+ to a volcano 11, and then back again because the v11 was too damn noisy and cooled just a couple of degrees lower. Have been eyeing the 7000 for quite a while, and plan to buy one when I switch to P4, but will certainly get one sooner if they support 462.
