Well things like COUT in some files have to start with 'using namespace std;' or i would have to change every COUT (and a few others like istream) to 'std::cout'

And about the std:: in the error screen by dos2unix.cpp: I have no clue. I haven't put it in that file

EDIT: forgot to tell that dos2unix.cpp still gives the error when i do add 'using namespace std;' so that isn't the problem

Not talking about adding "using namespace std;" I'm asking why you're converting it in the first place?

Because i want to use it and its to old to be used on any recent compilers without converting headers and making it compatible the standards the C++ commision has set. (using namespace std;)

It does meet the standards of 1999 but it doesn't meet the standards of this time
