EDIT3: When i change #if D3DX_SDK_VERSION != 30 to #if D3DX_SDK_VERSION <= 30 it does seem to compile as it should. This way you should be able to use all version after August 2006.

Um is that a good idea?
and if so .. why not just remove the line instead of adding "<="?
Actually it comes down to the same point as having to change the _MSC_VER_ == 1400 to _MSC_VER_ <= 1400 in engine_common.cpp (or something) to compile scripts on VC2008.

And i think you could delete the line BUT only if you also delete the 2 following lines otherwise it would ALWAYS give the error you have to change the Delay Load DLL.

I just changed it to #if D3DX_SDK_VERSION <= 30 so i cant use any older SDK than August 2006. If you would use older it would maybe not work because it is to old. This way i eliminate the possibility of using older SDK's than August 2006.

The *reason* for that #if being exactly the way it was is so that the warning always triggers if you don't have the SDK matching that version number installed. If the DLL file says 41, the D3DX_SDK_VERSION is 41 and the line should be changed to read #if D3DX_SDK_VERSION != 41

True but i changed it to <= 30 so even if i get on a PC with a version between 30 and 41 i still can compile it
