warrantoInfinint, what you are talking about is absolute zero, or zero degrees kalvin. Cryogenics could be deemed time travel, but unfortunatly with todays current technology the process of freezing you would kill you as it would hae to be an instant freeze, and not something gradual.

Read the James Rollins book Ice Hunt, it speaks of certain animals that have the ability to withstand freezing, take frogs for instance, they have a special glucose chemical that fills their blood whenever it starts to freeze outside. This glucose solution is made by a certain gene. If this gene could be put into humans, then theoretically, freezing someone would work. Glucose keeps things from dying when they are frozen by breaking the ice crystals that form during freezing into much smaller pieces that are harmless.
