I seen on TV about this guy who lives in northern U.S. somewhere in the woods, he is of course rich and paid a lot for this setup. His house is powered by solar energy during the day, then at night it runs off hydrogen. He has solar panels to gather the energy all day, and the excess is converted into hydrogen and stored in tanks.

I am not a scientist or an engineer, but I would imagine that this should be able to be downsized and put into vehicles.

I once heard that enough solar energy hits the earth in one second to power mankind for a whole year.

Kinda stupid really when you think about it, we have the power coming at us, we have the knowledge to harness it, but we instead put billions of dollars into the oil industry. They have way to much power over it all, they could wipe their ass with 4 ply toilet paper made out of \$100 bills and not think twice.
