Above post: BWAHAHAHAA.

Back on topic, I actually had an idea the other day after reading about orbital satellite telescopes, radio sensors, etc. What if we were to use the moon as a base for celestial research? As the moon has no atmosphere it makes for a better location for sensors and because of the gravity difference. The only problem I could see is the gravity difference, which could likely make things just not work right.

Is this material for another topic?
