zunnie wrote on Mon, 07 December 2009 00:36 If you run the server from the same pc as you run gamespy, you can't see the server.

You can join it by using for example RenIP and connect to the LAN IP of your server. In most cases 192.168.0.1

To find out your lan ip open a command prompt and type:
netstat -an

It should then list your LAN IP as well.

Also you need open and forward UDP ports in fw or router.
