A while back I asked how to change the color of lasers. I then asked how to use them on multiplayer. Dante told me to temp it. I dont know what he meant by that or how to do it. I asked around some more so someone told me how to use a custom objects.ddb file online. It worked but I kept getting the 0 bug so I stopped because it wasnt worth it.

I still have not understood how to temp something. Will it work online without the 0 bug?

Exactly how am I supposed to temp it?

I just want to use a different colored laser online without any porblems
