I would suggest you hammer your gateway with pings and see if there are drops in the same amount as when you ping websites.

If the drops are high going to your router - it's your wireless/cabling/router thats the problem. If to your router can be proven fine then you can contact your ISP to have them test the path from your house to them - could be bad cabling going to your modem

Ok; ran a few more tests.

First two tests over 100 hops came back 100%

The second last test I increased the byte size to the maximum setting (32000; the outcome was 3% lost. I don't think it is normal to lose 3% to your own gateway.

Last test is just Wtfmode. Only 8 byte packet size and 70% loss.

Edit: I seem to lose alot more packets with the program than I do with CMD. I average around 6& loss with PingTester and 0% with CMD.
