`$_POST[x]` would have worked, `$_POST['x']` wouldn't have done, unless you used one of the two methods outlined above. However it is always good practice to use quotes around array indexes which are strings, otherwise you could find that a constant you define in one place screws up a load of other scripts which used the name of that constant as an unquoted string array index.

EDIT;

Interestingly, I notice Crimson already mentioned using curly braces around array indexes in strings about 4 or 5 posts into this topic...
