Uhh... it wouldn't be the first time AVG has tried to delete legitimate Windows files and render the machine unbootable...

<http://www.tomshardware.com/news/avg-antivirus-virus-removal,6587.html>

AVG is a resource hungry, CPU hogging heap of shit which you should avoid at all costs. You would be better off with MSE, it's actually a pretty good AV.

wow I thought avg was at least a decent anti virus. you would think any basic anti virus system could tell the difference between system files and known virus detentions. I have been using mse since windows 7 came out.
