Well im not really an expert.
But i was wondering if it is possible to put a var into a var while quering a result into a database.
An example is the following.

```
$usermenures = mysql_query("SELECT * FROM usermenu ORDER BY id");
while($usermenuget = mysql_fetch_array($usermenures)){
echo '<li class="usermenulist"><a href="'.$usermenuget['link'].'"
class="usermenulinks">'.$usermenuget['langnl'].'</a> / </li>';
}
```

Now you see
$usermenuget['langnl']

I was wondering if i could change langnl into a var, for example.

$usermenuget['$languagevariabele']

$languagevariabele could be langnl for a dutch label and langen for a english lable.

This didn't work, but does anyone know how to get this done?
