Excellent build and it would be really sweet if you went with RAID0 instead of RAID1 on that array. The speeds would be ridiculous and considering you would have another array you could just take a monthly system image and store it on those mechanical drives.

As for PSU I could not be more happy with my SeaSonic X-Series PSU. It is modular, Gold Level efficiency (cause I also pay the hydro bill), and the fan is barely even on it runs so cool. The AnandTech review is here: http://www.anandtech.com/show/4217/seasonic-xseries-560w

For your system I would probably recommend the 650w or 750w unit. They are all the same 850w PSU chassis and just tuned down to provide the necessary output levels.
