Right now it supports SQL Server (2005(untested, currently)/2008/R2). Off the top of my head here are the planned features (in order they will be pushed)

1) TFS Integration
2) Oracle MySQL support
3) Web API

A service that will also be available is that I will provide FaultTrack hosting. This is something that is easily already provided. Essentially you may not have to purchase a license, but there would be a monthly fee (I have not decided anything having to do with sales pricing, focusing only on development phase right now). But there are a lot of possibilities.

I will be getting a web page on the site up for it soon, but that's on the backburner as I also just put my framework up on source control (open source) and am also working to get that exposed on the side.

There's a huge list of possible features to come, but right now KISS feature development is the goal.

The database setup looks something like this:
