There isn't really much point in selling a graphics card such as the 460

1. You probably won't get a good price for it
2. Its already a future proof graphics card, I'm guessing you can play most if not all games in high quality, as long as you aren't running super resolutions?

http://www.videocardbenchmark.net/high_end_gpus.html Shows the comparison between benchmarks for different cards, without even having to scroll both the cards listed there are near the top, granted the Radeon 6950 is way closer to the top, but still the 460 is high up in the "High end GPUs chart".

I have a GTX 285 OC Edition which is just below the 460 SE and I can run anything, so no reason why you cant and probably shouldn't sell.

I was just thinking, another option could be to get a second 460 and run in SLI, however, even if you are running SLI, apparently it doesn't mean you can add more monitors to it

http://www.slizone.com/object/sli_multi_monitor.html#confoptions

What you could do I supposed is either run a monitor off your integrated graphics if you have any, or get a crap graphics card that you wont assign to any gaming use, and just connect monitors into that, might have to google that to see if it works, Im sure the diagrams on the slizone website are suggesting its possible though.

However this all depends anyway if your motherboard has another PCI-E Slot, newer motherboards tend to anyways
