Spoony wrote on Mon, 27 February 2012 05:08Quote:Our brain is perhaps the most complicated thing ever created. If the brain is the product of random chance, then this violates the principal of causality, (you cannot get more in the effect than the cause). If there is intelligence in us, man, the effect, then there must be intelligence in the cause. The universe built off random chance has no intelligence thus there must be a cause for human intelligence that transcends the universe, an intelligence behind our physical universe.

uh, random chance? you used the phrase "survival of the fittest" earlier, so i presume you have heard of the theory of evolution.

I disagree with "survival of the fittest" its survival of anything that lives long enough to reproduce. And I'd have to say that anything is the "fittest" it'd be single cell organisms, as they've reproduced trillions of times more than us multi-cell organisms and yet they have remained at that base single cell level.

Quote:The next thing to ponder is if there exists such a being(s), then God(s) must have made an appearance in history.

that doesn't follow. even if i accept that yes the universe was created by a god (which i don't), then it doesn't follow that this god has revealed itself to us. it might have gone away, it might have died or something, it might simply not give a shit about us or not have noticed us turning up billions of years after it started the universe up...

He's sitting their with his mouse pointer over that "major flood" cheat menu right now.
