The version control features in LE are tied to a very specific version of a Microsoft version control tool called SourceSafe. We (TT) do not have SourceSafe nor do we know where to get it or how to use it properly if we had it.

The 4.0 leveledit has enabled all the LE features that are actually usable as things stand, all the other disabled features dont work (at least as far as I know, anyone who thinks otherwise feel free to correct me and we can put those feature back into a future version of 4.0)
