Hello guys,

Currently im looking into making a new Renegade montage, however this time I am going to put more effort in it then last video.

I already stumbled accross a problem which I am now looking at for over 6 hours and im kinda starting to lose my mind here.

Okay so here is the deal, basicly I use both premiere pro and after effects to create the video. The way I work now is edit/render the video first in after effects then import it as any other video file in premiere pro to mix them together.

The problem is though that I experience a significant quality loss after rendering files in premiere pro. However files rendered from after effects are of high quality. The strange thing is that orginal video files comming from my fraps folder render in good quality if I put them directly into Premiere.

This is my situation:

Original file (HQ) -aftereffects> (HQ) -Premierepro> (LQ)

Original file (HQ) -Premierepro> (HQ)

The file comming out of AE is basicly a 1:1 copy of the orginal fraps file so I don't get why premiere pro would fuck up the file so badly, while original files render without a problem.

Has anybody seen this before? Ive already tried dozen of diffrent codec combinations. Can anybody recommend me good settings or enlighten me a little on this matter?

Thanks in advance.

PS: this is how the LQ version looks like <http://www.youtube.com/watch?v=x8V7kqAxvs0>
