Xtrm2Mattl will never ever use Frames, if i have to, i'll use like..

```
<!--!include virtual="/path/to/file.txt"-->
```

or the php one

```
<?php include="file.txt"> i think.. something like that.
```

Who the hell cares that you'll never use frames?

Why exactly don't you like frames? Because they make loading faster? Because they make it so you only have to update only one html page instead of every page without frames? Because they look good? Because you don't know how to use them? etc?
