zunnie wrote on Fri, 09 August 2013 11:44 Some servers don't allow certain files to be modified to stop cheating.

Sometimes mapmakers include modified versions of files that are blocked by the anti-cheat, but which shouldn't (read: the server owners should add it to a whitelist).

To get rid of the file simply goto your Application Data folder, there go into Renegade, then Client and finally ttf.

Go into the files folder and find the file and delete it.

To goto your Application Data folder simply type %appdata% in the addressbar of your file browser and it should go there.

Assuming he has 4.0 installed, which is unlikely given he downloaded a map pack instead of just joining
