As for the .pkg file stuff, how exactly do you configure the packages in the configs (I know the svrcfg_cnc.ini stuff but what are you doing in tt.cfg etc?)

In the tt.cfg I put the lsd file name. For Example if I had a package named "package" and this package had a map named "map", in tt.cfg I put

rotation:

```
[  
  "map"  
];
```

I also noticed one other thing about this, with the stock system Westwood on-line would display "Package/Map" for map name, and this doesn't occur UNLESS you have the actual package in your data folder. If you don't have the package in your data folder you just see the map name listed on Westwood on-line, but for some reason if you do have the package name it lists it as package/map... its odd.
