mobydickls anyone able to run this game using a voodoo5 graphics card and if so could you please let me know which drivers you are using. btw I am also using winxp with directx 9.

Ray

I started playing Renegade with that card and had alot of problems (exmp.: being able to see through walls clear across the map!) but I was able to play once I set my color to 16 bit, like General Havoc said, and used 3rd party drivers. I'm pretty sure that 3dfx went under before DX8 came out and there's only so much tweaking people could do with the DX7 drivers, so I would say that if you're using XP with DX9 that there is little to no chance that you'll be able to run Renegade with that card (I was using Win 98se with DX8). If you're going to buy a new card, I would also recommend Nvidia. I bought a GeForce 4 4200 and it works great.
