Vegita246When pieces of land plunge into the ocean they cause waves, if the piece of land was large enough, combined with the shock wave, it would cause a huge wave. Any meteor big enough to "completely wipe France from the face of the earth forever" is large enough to environmentally destroy Western Europe. Also GB is the UK, i'm telling you this because your

reach the US, unless Spain fell off the map of course. The dust cloud formed by France getting wiped from the earth would at least remain over Europe for a few years.

Oh... I didn't notice the "(GB)"...

And a tital wave isn't formed until the shockwave reaches sea floor high enough... The shockwave can travel accross the sea floor until it gets near North America, than when it reaches sea floor that is high enough, it creates a tital wave.
