Hello,

We're preparing to release brenbot 1.30 (or 1.31 if necessary) to the public this month. While RenGuard support is mostly complete, I am not sure if we will include it. We will, if RenGuard gets finished within time. I don't want to delay brenbot because of RenGuard anymore.

For brenbot to work, you need to use the renegade LFDS wrapper I wrote few months ago available at <http://mac.tactical-command.de/renegade/>

Please see, if it is working and please note any distributions that need support for renegade wrapper/brenbot. I'll have to get it and package both application specifically for this distribution.

Also, report any problems with the wrapper here.

Supported Distributions:

Redhat 7

Redhat 8

Redhat 9

Suse 8.2

A win32 version with the same featureset is also planned.

Left to do on brenbot:

- Change !banlog to let admin search for banned users, do not display the entire list
 - Allow !kick <number> instead of just !kick <name>
 - Win32 Migration of Blazer's code into the main code.
-
