I installed it and all just fine... until I started up photoshop and got this:

I click ok, and it loads normally. I try to save as a .dds file, however, and the main problem with that is that the option to save as a .dds isn't there.

Whats the deal?

And is there a program that can convert .tga or whatever to .dds?

And what is the dll file? Where do I get it or whatever?
