/me hops on the bandwagon.

AMD Athlon XP 2400+
1024 MB PC-2700 DDR RAM
GeForce4 Ti4800SE
19 inch Viewsonic VG-191 LCD Monitor
100GB HD
40GB HD
8x DVD player (the ownage, I know :rolleyes:)

And Blazer bought all of those things for me.

I also lease two servers for Renegade:

Server 1:
Dual 2.4 ghz Xeon processors
1024 MB RAM
80GB HD
40GB HD
(Runs n00bsvr02 (aka Crimson79) - n00bsvr06)

Server 2:
Pentium 4 - 2.8 ghz
1024 MB RAM
80GB HD
(Runs n00bsvr01 and n00bsvr08)

Server 3: (will be decommissioned any minute now since I stopped paying and they stopped
charging at the end of February)
Celeron 2.4 ghz
512 MB RAM
40GB HD
(Runs n00bsvr07, used to be n00bsvr01)
(This box sucks)

And that doesn't count the other computers at the house... Blazer and I both have IBM T30
laptops from work, We have a computer in the living room for general usage and another in the
office (so we can have up for 4 people playing Renegade not counting the laptops)... we have a
Cisco router connected to a 24-port Cisco switch managing the home network. There's also
another shitty 8-port switch on the other side of the office, and another 8-port switch on top of the
TV to connect our Replay TV and XBox to the internet, plus you can use your laptop in front of the
TV and connect it to that switch, or just connect to our Linksys wireless AP.

Basically, we are geeks and proud of it.
