PCI slots process data at 33MHz AGP processes at 66MHz at 1x APG and there is a 2x 4x and 8x APG slot.

PCI slots work on 5volts

APG x2 works on 3.3 Volts

APG x4 works on 1.5 volts

APG x8 works on 0.8 volts

If you use an APG card find out what slot you have, you place an *x card in a 2x slot, you burn out the card, put a 2x card in an 8x slot, you kill your mother board or just your APG slot (if your lucky).

You want to pick a univercal card or have a univercal slot on your mother board.
