The first one is the temp on the CPU core. the second one is the temp under the CPU. the HD0 is the HArD drive temp. The last one is your case temp. You are running too hot for idle. Try playing ren for 20 min and then check your temps. :shocked: I would consider getting a new cooler. the are not expensive. this one will do u fine:

<http://www.hardcorecooling.us/index.asp?PageAction=VIEWPROD&ProdID=394>

also if u have a camera can u post picks of the cooler u have now.

Please post your mobo model number so i can see if it will fit.
