Xtrm2Matthydra1945You can add one more enhancement to that list: elimination of the damned "Invalid_session" message I sometimes get after I try making a post.

Simple fix:

Just hit "Back" then hit "Submit" again. Seem's to be a problem with the current version of phpBB, as another forum i visit has the same problem.It is a problem within version 2.0.4 of phpBB, if Crimson were to update to the latest version 2.0.5 it would fix it.

But... she's not going to do that anytime soon because she'd have to overwrite many of the files she's modified to make these forums look identical to ye olde westwood ones. Personally, i don't blame her.

The only time it happens to me is if my ISP dialup disconnects between when i'm writing a message and when i click the submit post. I usually just go back, refresh, then resubmit.
