once i actually get the syntax & protocol information:

"locate" will be integrated into the ssc, as well as some other various commands.

*note, this isn't a command list, only a settings list. all settings posted above, minus the [Server] settings will have the ability to have a temp setting posted on them (i.e. KickOnNotFound = true), it will effect the functionality only as long as the application is running, this is to provide quick change of settings at run time without requiring a restart (i.e. i need ot make sure that i don't kick on NotFound if the network happens to go down for maintenance).
