CrimsonThe problem was here:

--> php?>

The closing tag should be ?>, not php?>.

I have already fixed the error, may you have downloaded the fixed version, and btw. these are the possibilities for closing tag:

php?> = Full tag

?> = short tag

But the short tag must be enabled by the serverprovider so I recommend to use the longer tag to prevent problems with server that disable the "allow short tag" in the config

Quote:short_open_tag = On ; allow the <? tag. otherwise, only <?php and <script> tags are recognized.

(I cut that out of my PHP.ini config if you do not believe me)

and the same way also the closing tag works with the long and with the short version.

But thanks that you tried to help

What do you think about the script? I'm just new at PHP Skripting and I heard you have a big knowledge of this language.
