I have been using leveledit for ages and I have never experienced any bugs to do with the taskbar going funny.

But, rest assured, if I am able to reproduce the bug in question, I will try to fix it.

I suspect (from the description) its got something to do with leveledit leaking memory somewhere.

For those who are experiencing the bug, what is your hardware:

amount of RAM

video card (type + amount of RAM)

CPU type and speed

Size of hard disk and amount free (if you have no free space, windows cant make as much virtual memory and will run out of RAM faster)

Also, can someone who has the bug on XP open leveledit, make the bug happen then do ctrl-alt-delete to open task manager. Look at leveledit, is it using lots of CPU, RAM or both? If so, it helps to narrow down the problem.

Assuming it is a memory leak or out of memory condition, I probably wont be able to fix it even if I could reproduce it.

With source code I would just link it against NuMega BoundsChecker and let that find memory leaks and issues.

But without source code, there isnt much I can do
