Page reply script for server moderators, allows you to just type /r message instead of !page wolname message. Works for both BReNBot and BlazeRegulator .Net.

http://eoehost.servegame.com/eoe_ftp/users/snipesimo/snipesimoprivate/pagereply.mrc

To install download the file to your mIRC directory then open mIRC and type /load -rs pagereply.mrc then whenever someone pages a server and you wish to respond to that person, all you have to type is /r message.

Note: I do realize that npsmith made something like this a long time ago, but mine is updated and isn't so involved to get working.

So much functions that arent needed, well i think so. This should work better

```
alias /r {
  msg %recentpagechan !page %recentpage $1-
}
on *:TEXT:[PAGE]*:#: {
  set %recentpage $2
  set %recentpagechan $chan
  halt
}
elseif (Page From isin $1- {
  set %recentpage $3
  set %recentpagechan $chan
}
}
```

Those functions, \$strip and \$remove arent need that much. With mirc u can use \$1. That will select the first word. It should work. Ill test it when i get back later.

}
```

Those functions, \$strip and \$remove arent need that much. With mirc u can use \$1. That will select the first word. It should work. Ill test it when i get back later.

Actually u need \$strip and \$remove, especially if you don't have mIRC to strip the color.

BR reports in bold and color, so you use \$strip to remove the bold and color. BR and Brenbot use : at the end of players name so you need \$remove to remove the colon marks otherwise the scrip would send this out /r playername: but using \$strip and \$remove it would do this /r playername sending it to the correct person.

Snipesimo was correct on the original coding.
