Server Side Specification for RenGuard is available. This is for developers of Renegade Regulation Programs that want to add native RenGuard support into their application.

Is is very straight forward, and should not take too much time. If you are interested, please pm me, and provide me with solid proof of your application.

Thank you,
mac

Is the RG team willing to release this to me for the purpose of making a personal location bot, or should I wait until paging etc is integrated to the client? (Will you be able to release the specs to that if/when it happens)?

I am in the process of building a script in which you send a request to renguard.com and get a response back to use in script building -- like:

`http://www.renguard.com/blahblahnnonexistent.php?user=simo`

And it will return something like:

```
snipesimo [RG] n00bstories Server 1  
Blahsimo Idle
```

This should help you in your script writing. I have already written a couple scripts like this for Speedy to make mIRC bots with.

Yea I helped him with that as well. I got the specs from mac, I will probably just hook a fake server to the network and get the info that way.

I already have plans to do a buddy list in the next week or so and as you know, we're discussing paging between users.

Does anyone want me to create an mIRC SSC? I have my script working, and no real need for an mIRC SSC, but if someone requests that I make it I will.

Since everyone would be able to see the source thats probably not a good idea.

Which would be the reason by me not making it public, only private releases for things like mIRC moderation scripts. That, or I think of a way to encrypt it...
