Ok, I'm a bit of an idiot when it comes to matters like these, but I just noticed my refresh rate is 60 Hertz, but I can set it up to 75. Should I do it? I made it that for a few seconds and nothing too special happened... does it increase performance or what? Would it hurt my eyes?

it would do the exact opposite, it would help your eyes.

I set mine one setting below the max load my monitor can take.

in full screen mode, ren will go at max fps set for the monitor. (well i think) my monitor is set to 60. i never got over 62 with that in full screen. in windowed mode i did 300 fps in a game and 508 fps in the menu

p4 2.6 with Hyper threading technology, 512 mb ram ddr 333mhz, mother board has 333mhz too. my video card is a GeForce FX 5600 ultra with 128 mb ddr ram. support 400 mhz.

my video card is a geForce Fx 5600 ultra with 128 mb ddr ram. support 400 mhz.

Go to your nvidia settings and uncheck V-sync and your refresh rate wont be locked to your monitor settings in fullscreen mode.
