Client side is in C? just C, not VC++/MFC. i thought that C is just like a command prompt type of language and has no complex vissual component unless you use like a shit load of (line, circle, oval, rectangle, setcolor, setfillstyle, floodfill...) commands. Did C change in the past 6 yeas sence I used it last? What C commands let's you bring up a wabpage, make buttons and use the mouse?

Pure C. No MFC at all.

ok i get it now. C is used to call API functions that make all the visual stuff. But 6 years ago when i was learning/playing with C i didn't know that API's existed. Only later on when learning VB i found out about API's and just assumed that they are primarily used 4 VB and not other languages. TY 4 the info
