Hello all.

I currently have one server up and its running fine with Brenbot installed.

I would like to set up 2 more servers or "instances", but I am a bit unsure of how to do this. I have seen other people's servers on Gamespy that use the same IP address, so I know there must be a way to do that. I'm not sure if I need to completely set up new folders for each server, or if I can just set up different server.ini's and svrcfg_cnc.ini files.

If anyone can help it would be greatly appreciated.

Once again its probably something simple I just can't figure out.

Thanks

Run BRenBot from a second directory for each server you want to monitor.
