I wanna make it so people can search my download pages that are in HTML (can be put into PHP) but I want it to be a flat file thing. Any ideas (flat file robot thingy that only tracks my site maybe?)

Try this: http://www.google.com/searchcode.html

Scroll down to where it says "What could be better? Search me."

and then to customize the search so it more closely resembles your site go to this site: http://services.google.com/cobrand/free_select
