Holy Shit....

That is nuts...I have never seen a chip do that. Gonna show my AMD crazied friend that.

Here is another great one:

LN2

[View Forum Message](#) <> [Reply to Message](#)

It will do that without overclocking. Thats why your system wont start if there isnt a fan present.

Somesay it is fake and that it would melt. With no personal experience or actually photos of a "melted" processor I personally believe it blew up . Why?

A: The processor may have expanded to the point where there was some pressure created by it against the board it shot out like a cork in a wine bottle.

B: Its a hell'ofa lot cool to think of it that way

In my PC class we learned that if the processor fan goes out on a P4 it will melt in 90 seconds if messures ain't taken to cool it down in there

Majiin Vegetawhy was there a hole in the table?
must be fake

Thats the only place where I can find it to be fake. Unless thye cut the hole in the table so the processor would not burn a hole through it, since the motherboard is sitting directly on the table. The processor would still be getting pretty hot if was cooled properly. Most likely they put a firecracker there...

cowmisfitIn my PC class we learned that if the processor fan goes out on a P4 it will melt in 90 seconds if messures ain't taken to cool it down in there

Wrong wrong, This doesnt Count for The Pentium 4.

Since the (Willametta core) the p4 has a protection that as soon it notices its not being cooled, The pc wont boot at all (black screen) ore will shutdown as soon as possible

i forgot the name for this sort of protection.

But AMD has it to Since the AMD 64.

Older Proccesors (ea) AMD T-bird didnt have this protection

Meaning if u would run it without a cooler it would die soon (proibly)

About the melting part. i have seen a p4 black once on a pick, but that was some time ago HardwareOCP 4.0 Ghz... it died

JPWrong wrong, This doesnt Count for The Pentium 4.

Since the (Willametta core) the p4 has a protection that as soon it notices its not being cooled, The pc wont boot at all (black screen) ore will shutdown as soon as possible

Also it will downclock itself in case it gets too hot.

Tomshardware.com showed that AMD Processors (that they tested) all melted in seconds. However, P4s slow down enough to cool themselves, and if not, they turn the system off automatticaly.

Wow! PC class... everyone in my area doesn't know anything about computers, they all suck at it and all they talk about are sports, fucking annoying when you go: "Hey, teacher said to center the poem." And the responce is: "How the fuck do I do that?"

They all talk about sports, sleep dreaming about sports, get girl friends just to say they have them, and all the while hate each other behind their backs. I'd rather be a friendly computer geek.

My school is the first completely wireless in the nation, we won a bunch of grants (and yes its public school). Every room has Dell Laptps (30 of them) and we don't use black boards, we use Smart

Boards (big touch computer screens basicly)

I've completed A+, im currently taking Advanced CISCO networking class, and Microsoft class so i can be certified in a range of Microsoft products.

Scene_1_AMD_Duron_Vaporizing_final_divx_lq1

this video is such a fake i cant even watch it again, in my entire live ive never seen cpu exploding like that, and they took off cooler pretty easily, also u know how hard is to crash cpu into 3 pieces? overheating wouldnt break cpu into 3 pieces, nor make a hole in the motherboard, also, this computer wasnt even hooked up to the monitor, what u can see on the monitor is proly from the different computer..

[View Forum Message](#) <> [Reply to Message](#)

Neither, it just fried and the motherboard got bust also I think.
I wasn't really bothered about it because I recently was given an AMD AthlonXP 2000+ at the time

2 week ago, I upgraded to an AMD AthlonXP 2600+ I again forgot to put the HeatSink on, but luckily, I forgot to press the on switch on the PSU to which then I noticed I forgot to put it on
Its all 1337 now anyways

It's fake, I don't think a cpu can explode. It might start to melt, But when it's start melting, The cpu is damaged and the system will stop running.

Plus, That cooler/fan isn't working.

1: They pick it off such easy
2: The fan isn't spinning

Subject: OT: Extreme Overclocking
Posted by [icedog90](#) on Sun, 09 Jan 2005 18:05:58 GMT

icedog90I think we already confirmed that it was fake. If you look closely in the movie, there is a string attached to the fan when he pulls it off.

Do you mean the power cable? Every CPU fan has a power cable, that doesn't prove anything. But that doesn't mean it's genuine either.

You took this video way too seriously my friend. How often do you get to see someone put explosives (firecracker) under a motherboard?

icedog90Even though this can't possibly happen, this made me laugh so freakin' hard.

See thats what it was meant to do.

Subject: OT: Extreme Overclocking
Posted by [Doitle](#) on Mon, 10 Jan 2005 13:29:50 GMT
[View Forum Message](#) <> [Reply to Message](#)

I watched this. They put a firecracker under the processor. You can see it through the hole in the table when they look through it. Why would a processor "vaporize" with a orange flame? A Processor won't burn so where is the flame from? There's your final verdict.

Wel LOL i recently had a dumb mistake just had bought a new motherboard on a store amd athlon 64 3200 with gigabyte motherboard and 1024mb ddr

well i thought i had done evrything right i turned it on and i thought what a strange smell well then after about 10 seconds i turned it off and i saw that i did the memory placed wrong one 512mb ddr was burned and also motherboard on that spot was black and burned he still works only the 3d card has problems i need to push it realy hard on the motherboard ore else the screen doesnt goes on and afcourse that burned spot on memory slot i cannot use ever again

But i have learned from it
