Anyone know a web portal I can easily integrate with my current site?

IRON FARTAre you talking about things like PHPnuke?

Something like that I suppose, PHP of course, I'm looking for something that I can either integrate onto my site using PHP includes, or something I can intergrate my site into.

Man, I love that word, integrate.

Maybe try integrating mambo?
or try integrating PHPNuke?
or try integrating PostNuke?
or try integrating e107?

or searching google for "integrating intergratable site things that can be integrated"?

I tried all of the above, they all hate me with a passion.

Actually, can someone just direct me to a way to write HTML into a MySQL database then a way to put it onto a PHP page? And have it so it's searchable? That would be a nice little tutorial..

Thanks.

I heard JetBox is good with integration. Try taking a look at opensourcecms.com

Actually, can someone just direct me to a way to write HTML into a MySQL database then a way to put it onto a PHP page? And have it so it's searchable? That would be a nice little tutorial..

Thanks.

That shouldn't be hard to do at all. If you don't mind using phpMyAdmin to put the information in the database (form could be made if you really needed to), it'd take a couple of minutes.

Quote:Okay, I need some help.

Can someone tell me how I can include the HTML data from a MySQL table? So it would be:
http://www.trielite.net/?p=table_name

And then it would include the data from that table in a certain area? (Maybe with PHP includes?)

Can you also explain how the code works?

First you need to access the database

The variables will have to be set, your host, username, password and the database being used.

Then you'd want to create a table and database, let's name these both "temp" for now.

Two columns, page and html

blah.php?page=whatever

```
$page = $_REQUEST['page'];
```

```
$link = mysql_connect($sql_host, $sql_user, $sql_pass);  
mysql_select_db(temp, $link);
```

```
$result = mysql_query("SELECT * FROM `temp` WHERE page='$page'");  
$myrow = mysql_fetch_array($result);
```

```
echo $myrow[html];
```

Note: this is a VERY simple sample of what code would be used.
